## **Imaging Pipeline Ingestion Framework: Typical Implementation Approach**

## **Detailed Requirements Phase**

**Development and Configuration Phase** 

**Operational Readiness** 

Planning and Discovery (Week 1-2)

Design and Implementation (Week 3-10)

**Operational Readiness** is a gated check to ensure we receive the following before project kickoff:

- Building the core implementation team
- Define implementation scope and obtain signoff Project charter from sponsor
- Develop Communication plan and RACI matrix

- Begin project planning and requirement gathering process with the client stakeholders
- Request for medical imaging files and associated data files for multiple research studies or ologies acquired within the client environment
- Analyze the data and the metadata to understand ingestion requirements for cloud imaging platform or repository
- Document metadata management requirements based on clients targeted biomedical imaging research needs

- Design HL7 FHIR framework based on the requirements gathered
- Mapping of required metadata in FHIR framework;
- Integration of framework in Imaging pipeline in test
- Usecase design and test plan
- End to End workflow testing
- Sign off and acceptance from the client
- Configuration in production and Go live

- Migration Services Competency
- Healthcare Services Competency

Client will be responsible for providing test data per Citius Tech's request. Citius Tech will perform data analysis and discovery to create HL7 FHIR framework for targeted research. Citius Tech estimates a 10-week timeline after operational readiness is complete.
